

Adala

Final year project

Student: Hamad Almarri

SID: 200294236

Major: Software Systems Engineering
University of Regina

What is Adala

Adala is a software project that facilitate law enforcement processes (Police and Investigation) to let them manage and monitor different police cases. It will have also a database of people, cars, addresses, and properties, and It will support work-flow such as open/foreword cases to be a special cases for investigation purposes, which will include work-flow actions such as approve and deny processes.

Police cases can be incident/accident reports, or arrest reports.

Features

- Everything as an entry can be associated with anything else under a relation name (i.e. relate a person with suspicious car)
- Logging any changes on data
- Monitoring and reporting for police cases
- For new crime, giving suspect criminals
- Suggest names of youth in risk
- More

Classify the Criminal/s

Artificial Neural Network will be implemented so the software will be able to classify criminal/s based on the cases' inputs and by utilizing previous data the software will provide suggested criminal/s' attributes that are based on the results coming from Artificial Neural Network (ANN) model.

Crime Prevention

The software also should be able to apply crime prevention for youth at risk by collected and analyzing history data of a young person and the software will be able to classify that person if he/she has high probability of being a criminal in the future.

Incident Report

Case Title:

Man has been killed in downtown

Description:

A man found dead late Sunday at a downtown parking garage was apparently assaulted at another location several hours earlier.

The still-unidentified body of a man in his late 20s to early 30s was spotted shortly before 11 p.m. Sunday.

He was pronounced dead at the scene from what appeared to be blunt force trauma to the head.

HPD homicide detectives haven't identified any witnesses or suspects in the slaying. But surveillance video in the area is providing some clues.

The man is seen on video running near the garage about 4:50 a.m. Sunday. They believe he ran into the garage where he then collapsed and died.

The man was wearing a turquoise-colored polo shirt, gray plaid shorts and black tennis shoes.

ANN model

Sigmoid Function

Sigmoid Function

$$\text{using } \sigma(\beta, t) = \frac{1}{1 + e^{-\beta t}},$$

For feeding forward

The Derivative of Sigmoid Function

$$\frac{d\sigma(t)}{dt} = \sigma(t)[1 - \sigma(t)]$$

For Back propagation

Sigmoid Function

- Feed Forward implementation

```
void feedForward {  
    net = threshold  
    for (inputEdge : inputEdges) {  
        net += inputEdge.LeftNeuron.output * inputEdge.Weight  
    }  
    output = Neuron.sigmoid(net)  
}  
  
double sigmoid(double net) {  
    return 1 / (1 + Math.exp(-net))  
}
```

Sigmoid Function

- Back Propagate For Output Layer

```
void backPropagate(...) {  
    for (int i = 0; i < this.numberOfWorkNeurons; i++) {  
        n = neurons[i]  
  
        // update error  
        n.setError(derivativeOfSigmoid(expectedOutputs[i], n.Output))  
  
        // update delta threshold  
        n.updateThreshold(learningRate, momentum)  
  
        // update input edges weights  
        for (Edge e : n.InputEdges)  
            e.updateWeight(learningRate, momentum)  
    }  
}
```

Sigmoid Function

- Devivative of Sigmoid implementation

```
double derivativeOfSigmoid(double expectedOutput, double output) {  
    return (expectedOutput - output) * output * (1 - output)  
}
```

- Updating the threshold implementation

```
void updateThreshold(double learningRate, double momentum) {  
    // update delta threshold  
    deltaThreshold = learningRate * Error + momentum * PrevDeltaThreshold  
    // update threshold  
    threshold += deltaThreshold  
}
```

Sigmoid Function

- Updating Weights implementation

```
updateWeight(learningRate lr, momentum m) {  
    // update delta weight  
  
    DeltaWeight = lr * rightNeuron.Error * leftNeuron.Output + (m * PrevDeltaWeight)  
  
    // update weight  
  
    weight += DeltaWeight  
  
}
```

Creating Fake data

- Based on the results in “Bayesian Network Modeling of Offender Behavior for Criminal Profiling” paper
- Abstract —A Bayesian network (BN) model of criminal behavior is obtained linking the action of an offender on the scene of the crime to his or her psychological profile. Structural and parameter learning algorithms are employed to discover inherent relationships that are embedded in a database containing crime scene and offender characteristics from homicide cases solved by the British police from the 1970s to the early 1990s

Creating Fake data

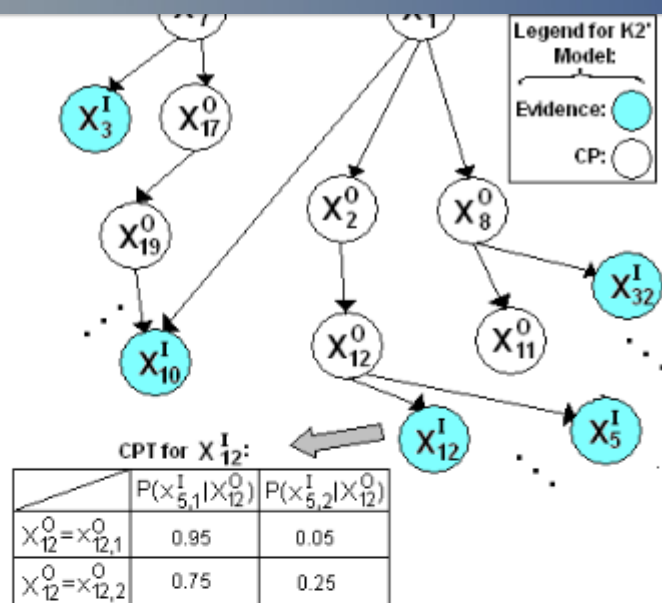

Fig. 3. A slice from the actual full BN structure that is learned from data by the K2' algorithm (CPTs are not shown for simplicity).

relations among the input variables. The modified K2' algorithm is faster, more effective, and requires fewer number of training cases for learning a BN from data for the purpose of predicting a criminal profile. This paper shows that additional conditional independence relationships can be effectively incorporated into the learning procedure to increase the final model performance. Inhibiting nodal connections systematically decreases the search space and is shown to improve the model performance considerably. Most importantly, the K2' requires a smaller sample of training cases than the K2 algorithm, which may otherwise lead to ZMP predications. This attribute is particularly useful in applications where

TABLE III

DEFINITION OF THE CRIME SCENE VARIABLES.

Variable	Definition
X_1^I	Vaginal penetration
X_2^I	Anal penetration
X_3^I	Foreign object penetration
X_4^I	Victim found face up
X_5^I	Victim's face not deliberately hidden
X_6^I	Victim partially undressed
X_7^I	Victim naked
X_8^I	Clothing damage
X_9^I	Bound (at one point)
X_{10}^I	Blindfolded (at one point)
X_{11}^I	Stabbed
X_{12}^I	Blunt instrument
X_{13}^I	Manual method (e.g. strangulation)
X_{14}^I	Shot
X_{15}^I	Wounds to head
X_{16}^I	Wounds to face
X_{17}^I	Wounds to neck
X_{18}^I	Wounds to torso
X_{19}^I	Wounds to limbs
X_{20}^I	Multiple wounds to one area of body

Creating Fake data

Variable	Definition	Arcs (children)
X_1^O :	Prior theft	$X_2^O, X_8^O, X_{21}^O, X_{10}^I, X_{24}^I, X_{25}^I$
X_2^O :	Prior burglary	$X_3^O, X_4^O, X_6^O, X_9^O, X_{12}^O, X_{26}^I$
X_3^O :	Prior violence	X_4^O, X_8^I, X_{12}^I
X_4^O :	Prior damage	X_5^O, X_{20}^O
X_5^O :	Prior disorder	–
X_6^O :	Prison	X_9^O, X_{12}^O, X_3^I
X_7^O :	Young offender between 17-21 years	$X_{10}^O, X_{17}^O, X_2^I, X_3^I, X_9^I$
X_8^O :	Unemployed at the time of offense	$X_{11}^O, X_{14}^I, X_{32}^I$
X_9^O :	History of sex crime	X_{13}^O
X_{10}^O :	Armed service	–
X_{11}^O :	Familiar with area of offense occurrence	–
X_{12}^O :	Male	$X_5^I, X_{12}^I, X_{31}^I, X_{35}^I, X_{36}^I$
X_{13}^O :	Knew victim	$X_{15}^O, X_{19}^O, X_{20}^O, X_{27}^I, X_{28}^I, X_{30}^I$
X_{14}^O :	History of abuse	disconnected
X_{15}^O :	Suicide (attempted after crime)	X_{16}^O, X_{21}^I
X_{16}^O :	Psychiatric or social problems	X_{28}^I, X_{34}^I
X_{17}^O :	Prior fraud	$X_{19}^O, X_{14}^I, X_{33}^I$
X_{18}^O :	Related to victim	$X_6^I, X_{11}^I, X_{19}^I, X_{21}^I, X_{24}^I$
X_{19}^O :	Relationship with victim	$X_{20}^O, X_{10}^I, X_{35}^O$
X_{20}^O :	Blood related to victim	X_{32}^I
X_{21}^O :	Turned themselves in	$X_1^I, X_4^I, X_6^I, X_{24}^I, X_{29}^I, X_{31}^I, X_{33}^I$

Creating Fake data

- Picked random number from 1 to 21 to pick on offender profile attribute
- Based on the archs make all children to true (either offender profile or crime scene attributes)
- Save offender profile and crime scene entities in the database with relationship one to one
